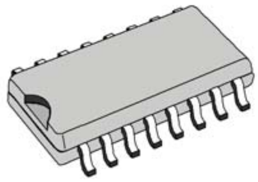
HVLED815PF

Offline LED driver with primary-sensing and high power factor up to 15 W

Datasheet — production data

Features

- High power factor capability (> 0.9)
- 800 V, avalanche rugged internal 6 Ω Power MOSFET
- Internal high-voltage startup
- Primary sensing regulation (PSR)
- +/- 5% accuracy on constant LED output current
- Quasi-resonant (QR) operation
- Optocoupler not needed
- Open or short LED string management
- Automatic self supply



SO16N

Table 1. Device summary

Order code	Package	Packaging
HVLED815PF	SO16N	Tube
HVLED815PFTR		Tape & Reel

Applications

- AC-DC LED driver bulb replacement lamps up to 15 W, with high power factor
- AC-DC LED drivers up to 15 W

Description

The HVLED815PF is a high-voltage primary switcher intended for operating directly from the rectified mains with minimum external parts and enabling high power factor (> 0.90) to provide an efficient, compact and cost effective solution for LED driving. It combines a high-performance low-voltage PWM controller chip and an 800 V, avalanche-rugged Power MOSFET, in the same package. There is no need for the optocoupler thanks to the patented primary sensing regulation (PSR) technique. The device assures protection against LED string fault (open or short).

4 Device description

The HVLED815PF is a high-voltage primary switcher intended for operating directly from the rectified mains with minimum external parts to provide high power factor (> 0.90) and an efficient, compact and cost effective solution for LED driving. It combines a high-performance low-voltage PWM controller chip and an 800 V, avalanche-rugged Power MOSFET, in the same package.

The PWM is a current-mode controller IC specifically designed for ZVS (zero voltage switching) flyback LED drivers, with constant output current (CC) regulation using primary sensing feedback (PSR). This eliminates the need for the optocoupler, the secondary voltage reference, as well as the current sense on the secondary side, while still maintaining a good LED current accuracy. Moreover, it guarantees a safe operation when short-circuit of one or more LEDs occurs.

The device can also provide a constant output voltage regulation (CV): it allows the application to be able to work safely when the LED string opens due to a failure.

In addition, the device offers the shorted secondary rectifier (i.e. LED string shorted due to a failure) or transformer saturation detection.

Quasi-resonant operation is achieved by means of a transformer demagnetization sensing input that triggers MOSFET turn-on. This input serves also as both output voltage monitor, to perform CV regulation, and input voltage monitor, to achieve mains-independent CC regulation (line voltage feedforward).

The maximum switching frequency is top-limited below 166 kHz, so that at medium-light load a special function automatically lowers the operating frequency while still maintaining the operation as close to ZVS as possible. At very light load, the device enters a controlled burst-mode operation that, along with the built-in high-voltage startup circuit and the low operating current of the device, helps minimize the residual input consumption.

Although an auxiliary winding is required in the transformer to correctly perform CV/CC regulation, the chip is able to power itself directly from the rectified mains. This is useful especially during CC regulation, where the flyback voltage generated by the winding drops.

5 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: *www.st.com*. ECOPACK is an ST trademark.
